

# WATERING HOW TO

TO  
START

Shrubs + Flowers  
**30min Water**  
/ 2-3 times a week

Trees  
(on trickle at tree base)  
**45min Water**  
/ 1-2 times a week

ALWAYS ADJUST TO  
SITE CONDITIONS

BEFORE WATERING CHECK

- Soil Moisture
- Leaf Condition

Monitoring your plants lets you know when they're stressed and in need of adjustment

## FIRST 2 WEEKS

WATCH FOR SIGNS OF UNDER- OR OVERWATERING

**IF WET**  
*DECREASE*  
WATER FREQUENCY

Cut back number of watering sessions a week if landscape is over-saturated.

**OVERWATERING**

- Limp
- Spots
- Dull Leaves

**IF DRY**  
*INCREASE*  
WATER FREQUENCY

Add to number of watering sessions a week if landscape is wilted or crispy.

**UNDERWATERING**

- Wilted
- Crispy
- Orange Leaves

## AFTER 2 WEEKS

Continue to monitor for signs of under- or overwatering, **EVEN AFTER** a reliable watering schedule is established.

Once you've found the perfect watering schedule for your landscape, keep an eye out for problems, pests, or changes in weather to catch issues before they can take root.

## EACH SEASON

WATCH FOR SIGNS OF TEMPERATURE & RAIN FLUCTUATION

FREQUENT SPRING RAINS and cool temperatures mean less watering sessions / week

THE HEAT OF THE SUMMER and greater evaporation means more watering sessions / week

AUTUMN TEMPERATURES and rains means less watering sessions / week

WINTERS WITH LITTLE SNOW place ice cubes at base of evergreens / 2-3 weeks

## IN 3-5 YEARS...

Plants reach maturity. Continue to monitor during the Heat of the Summer for signs of stress in case additional watering is necessary.
